AB - RU2148878 NOVELTY - Fuel element has pair of electrodes, p-type semiconductor material formed on positive electrode, and system feeding homogeneous gas mixture with oxidizing and fuel components to point of contact between semiconductor surface and negative electrode. Both electrodes are solid structures; positive electrode is fully covered with semiconductor material except for point of power lead and is surrounded on all sides by negative electrode through gap except for point of gas mixture inlet and exhaust gas outlet.

- USE - Energy conversion.

- ADVANTAGE - Improved efficiency of energy conversion and reduced cost.
